

ELAC NAVIS Series

It's active driven, high performing and connected without being wired. The new NAVIS Series safely navigates when searching for valuable notes in music.

Concentrically arranged
The concentric arrangement of two sources improves reproduction in many ways. The cabinet minimizes effects caused by reflections thanks to its big radiuses.

Purely made of aluminum
The cones of the drivers are made of aluminum which ensures wide and smooth frequency response thanks to special details in construction.

Always active
Not only usable as a typical active speaker because the Argo series can be driven wirelessly as well. Each speaker easily adjusted to match room acoustics perfectly.

The development target was definite: the result has to be even more than state-of-the-art. The new NAVIS Series features the new eye catching design with trapezoid shaped cabinets and characteristic bottom plate made of aluminum die-cast.

The new developed drivers are equipped with aluminum cones while the 25 mm soft-dome tweeter is arranged concentrically. The self-powered NAVIS Series is using high efficient, but analog sounding BASH® amplifiers for low and midrange, while a class A/B amplifier drives the tweeter. The completely analog signal processing ensures highest quality of sound with a maximum of transparency and musical sense at any time.
